A Search for Short-Wavelength Neutrino Oscillations from a Nuclear Reactor

D. Berish

1. Introduction

2. Neutrinos
   - 2.1. Neutrinos in the Standard Model
   - 2.2. Discovery of the Neutrino
   - 2.3. Lepton Mixing
   - 2.4. Neutrino Oscillation
   - 2.5. Discovery of Neutrino Oscillation

3. Reactor Neutrinos
   - 3.1. Production of Reactor Neutrinos
   - 3.2. Measuring the Reactor Antineutrino flux and spectrum
     - Daya Bay
     - RENO
     - Double Chooz
   - 3.3. The Reactor Antineutrino Anomaly
     - What is it?
     - Possible solutions

4. Sterile Neutrinos
   - 4.1. Theory of Sterile Neutrinos
   - 4.2. Experimental Searches for Sterile Neutrinos
     - DANSS
     - SoLid
     - NEOS
     - Stereo

5. PROSPECT
   - 5.1. Motivation
   - 5.2. Experimental Site
     - HFIR
   - 5.3. Design
     - Segmentation
     - Scintillator
     - Shielding

5.4. Detecting Inverse Beta Decays
- Pulse shape discrimination

5.5. From Signal to Result
- Data acquisition hardware
- Data processing
- Calibration

6. Ac-227 as a Calibration Source
6.1. Motivation
6.2. Material Compatibility
6.3. Prototype testing in P50X
6.4. Event Selection in the PROSPECT AD
6.5. Detector Stability Results
6.6. Volume Variation Results

7. Inverse Beta Decay Event Selection
7.1. Selection Criteria and Efficiency
7.2. Properties of the Event Selection

8. Neutrino Oscillation in the PROSPECT AD
8.1. Analysis Method
8.2. Result

9. Conclusion
